THE SOUND-CONSIDERED CITY A GUIDE FOR DECISION MAKERS

THE SOUND-CONSIDERED CITY A GUIDE FOR DECISION MAKERS

The sound-considered city is a more resilient, more vibrant, more sustainable place. By making sound an explicit medium, city designers and decision makers can be empowered with a new tool to create the prosperous and healthy cities they want to build. Sound can be much more than noise that bothers. It can positively impact the way spaces are lived in, worked in, and played in for generations to come.

SYMPHONY**

SOUND ANALYSIS EXAMPLE

Why is it important to consider sound?
Sound levels in the city are understood to be high because of their poor sound quality. There are plans for a traffic sound analysis can be carried out with the aim of better understanding its causes and environment.

ALBERTBRIDGE ROAD

The level of background noise on Albertbridge Road in Belfast is extremely high. Traffic noise masks pleasant sounds such as people walking or leaves rustling. Pleasant sounds are not more pleasant sounds when it comes to the quality of walking - who stops and hears a conversation when you can't hear it? The specific environment of the Albertbridge Road is caught in a vicious cycle. It will not be more pleasant unless people contribute

more positive sounds, but as long as it is an unpleasant place in which to spend time, no one wants to be located. Reducing traffic noise would improve the space, but it would not necessarily make it more pleasant. What if there's traffic? Is the inevitable idleness of human activity? Urban designers could consider this through creating specifically shaped sidewalks along the road to which people stop standing time.

Albertbridge Road, 67dB, walking
As the sign shows the reading is rather high. It is not pleasant and also essential sounds because the traffic is sometimes coming so an alarm even due to the traffic lights. This is not very difficult to have a conversation walking past.

dB reading
67.00 with a scale of 10 with noise level.

Recommendation
No recommendation

Proposed sound
62dB with a scale of 10 with noise level.

Background sound
As a sign to create a public space, sounds walking, rustling, or sunlight light.

1 HEALTH AND WELL-BEING

For many cities, improving the health and well-being of citizens is a top consideration in future plans. In particular, many city planners want to promote physical activity through the careful design of streets, parks, recreational areas, and workplaces. Simply put, the more active people are, the better their physical and mental health.

Sound can have an enormous impact on whether or not people feel at ease being out and about in their cities. Streets and spaces which sound pleasant can promote physical activity and improve well-being in general - both important measures for mental and physical health.

BELFAST EXAMPLE NEWTOWARDS ROAD

Belfast's Newtownards Road is a well used arterial road into the city. However, it struggles to remain its role as a local high street due to a history of abandonment and political tensions. Belfast City Council has received millions of pounds in environmental improvement grants to renew the street scheme in 2014-2016. Although this particular scheme was important and well intended by both residents and businesses, sustained maintenance of the road remains low.

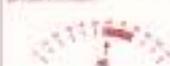

While traffic noise masks existing pleasant sounds such as people walking or listening, the variety of sounds surrounding the city of

is also very limited. There are few places along the pavement where people can "hang out" from the road edge because it is too narrow, making this a particularly unpleasant pedestrian route. With new plans for a new road to be built from such high levels of noise, both elderly and young people could be discouraged from walking along Newtownards Road and will limit the city's appeal. The sound environment and the availability of a city can help to improve quality of life and create an environment along the road to encourage people to walk into the town centre along the Newtownards Road.

Newtownards Road, 62 dB, walking

The sign shows the reading is rather low. It is pleasant and also essential sounds because the traffic is sometimes coming so an alarm even due to the traffic lights. This is not very difficult to have a conversation walking past.

dB reading
62.00 with a scale of 10 with noise level.

Recommendation
No recommendation

Proposed sound
High level with noise level.

to remain relatively accurate and seasonal. The more people vote for a particular spot, the higher its rating, the more likely the service will be to direct people toward it. In public locations, hot spots will be labeled by the “hot spot list,” further explained in that section.

Both members and non-members can plan travel or destination walks via Safari of the iPhone application by entering their location and the amount of time they have available, next to the map. They may then click the most popular hotspots in that area to plan a route corresponding to the given amount of time.

iv. an ear to you page

This is the section devoted to discovery and hunting. When it is set to quiet, quiet, remote, mountain, forest, inland areas filter to help users locate their local birdings. There is also an open source component where users can help one another by answering questions and contributing to discussions. It is colorful and fun but runs fairly deep in terms of how many birding a person can learn if they so choose.

When a member pays a gaze to complete a quiz, results are updated to the “ear to you” section of their profile page. This allows them to see their progress as they move through different levels.

v. ICE (It’s Not Yourself)

If users get frustrated by always having to walk by someone else’s garden to hear a bird, this is the page to help them. Whether they have access to a bathroom window or concrete lot, this page is full of information that can turn any window space into a bird magnet. Projects run from being very quick and easy, such as putting up a bird feeder, to quite complex, such as digging a proper pond. They can also be chosen according to what bird a user wants to attract. To assist in this decision, certain species with declining numbers, like sparrows and starlings in winter, for example, will be featured with easy tips on how to help them survive the cold.

vi SMART PHONE APP

To the user, the app is primarily a vehicle for taking a breather while in their day.

As mentioned, when a new member joins the online community, the app can be downloaded for free. It is then automatically synchronized with that particular user’s profile page. Any new changes made on the profile are automatically updated to the app, and vice versa, to avoid a dispersing of information. It facilitates the process of finding some where powerful, in any given neighborhood, within a certain amount of time.

If they choose to, users can set the birding alerts call as a reminder. When they respect to the area, they are automatically directed

to the “plan a walk” page. From here, all they have to do is enter exactly how much time they have available and the app, using GPS locating, plans a route within this given window.

Like with the live map, walks are planned by considering the most popular hot spots in an area that other users have visited. There are default hot spots throughout London for areas with low activity. Depending on the season, how often new hot spots are discovered, it is possible that a particular route from one location could vary from one day to the next.

Once given a route, all the user has to do is follow it. If they choose to, they can tag other hot spots along the way, or even vote for the

route they like by doing the same thing. Again, the GPS does all the work and again, the information is immediately updated to the website.

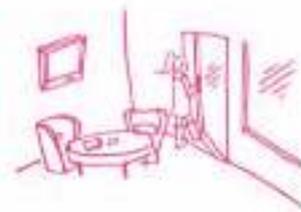

By entering in to their location on the map, they can view a list of the birds one can expect to hear in that location, the most common appearing first. Like with the hot spots, default lists would be provided in the beginning, in the hopes that increased user activity would allow access to real time data updating.

Selecting the image beside the name returns the screen and provides a brief description of the bird and its song. There is a large photo, and a few song tracks to play. Users can use the tracks for reference or to play out loud, prompting birds to call back.

Siri Majkut | 18 years
 is brand designer for a UK's television company in central London. Recently opened a **StagCity** profile page online. Has just eaten her lunch while working in front of the computer again, but today has programmed her phone to remind her to take a break, get some oxygen and focus on something different.

Heading to work, she picks up her iPhone and notes that she has 10 minutes to spare. ➔

The app generates a 10-minute walk for her by listing several "hot spots" in the area.

The app suggests her garden as a green spot and the coordinates are uploaded to a live map. ➔

In a park, she opens in on the map and sees what **POIs** are currently listed close.

Selecting one of them, she plays the song and a Starbucks cafe's back. She selects "found it" ➔

Back at the office, she logs her walk and sees the "findings" neatly added to her profile.

RTC PRESENT RESEARCH AT PARLIAMENT BUILDINGS, STORMONT

March 6, 2018

RTC's Dr Sarah Lippin and Dr Rachel D'Amico were delighted to present their latest research at the Northern Ireland Assembly's Knowledge Exchange Seminar Series (KESS).

The Assembly's Research and Information Service (RIS) jointly delivers KESS with the Queen's University of Belfast (QUB – co-founder 2011), Ulster University (Ulster – 2012) and The Open University (OU – 2013). It is the first of its kind in the United Kingdom, formally partnering a legislative arm of government – the Assembly – with academia. Aiming to promote evidence-led policy and law-making, KESS provides a forum in which academics present their research findings in a straightforward format, on issues that are relevant to governance in Northern Ireland. It seeks to bring those findings to the attention of key participants and decision-makers, including MLAs, the wider public sector and citizens, in a "high space" that encourages discussion, fosters improved understanding and seeks to enable opportunities for more in-depth engagement in future. (Source: nicassembly.gov.uk)

Sarah and Rachel presented at the session alongside Prof. Keith Attenborough of the Open University who delivered a fascinating presentation: *Acoustics for STKM and STIGAM*.
