Prior to this position, He was Professor of Design at Imagination, Lancaster University. He is also the Arts and Humanities Research Council (UK) Design Leadership Fellow (2017 – 2020). He has undergraduate and postgraduate degrees in design from Middlesex University, London and a PhD in product design assessment from the University of Westminster, London. He is the author of 9 books including The Routledge Companion to Design Research. (Routledge, Oxon, 2015). Among several editorial positions, Professor Rodgers is an Editorial Board Member of the Design Studies journal.

He split this position with the University of Southern Denmark. Before that he was Professor in Design Pedagogy at Northumbria University UK, and before that Professor of Design at the University of Canberra, where he was also Dean of the Faculty of Design & Architecture. His research deals with developing methods to discover how and why we don't know much about the idea of design, as well as finding ways to clarify the reason why "not-knowing" is an essential and valuable beginning point of practice.

Currently, he is pursuing a doctoral program in Global Innovation Design at the RCA, where he is investigating trust design at the intersection of AI, ethics, futures, and society. His research has been published and presented internationally at conferences at MIT, The University of Cambridge, The University of Manchester, the University of Côte d'Azur, The Design Museum or The Royal College of Art. He holds undergraduate studies in Structural engineering and Product design, and masters in Cognitive computing and Design research from Goldsmiths.

A DESIGN HISTORY OF THE COVID-19 VIRUS

INTRODUCTION

I2 INTRODUCTION

The Covid-19 crisis and the designed interventions we have catalogued in this book appear to prove definitively that design does care. We have documented this as it evolved every day from the 1st of January 2020 to 31st May 2020 inclusive. As the cover and back cover, influenced by the work of Sean Clarke, Antonio Voce, Pablo Gutierrez and Frank Hulley-Jones at The Guardian's 100 days project, illustrate, we look at all of this care and caring from the point of view of design and, by the sheer volume of design interventions we have documented, illustrate that design is good in a crisis.

What the Covid-19 pandemic has illustrated is that for the first time in modern history capital was totally irrelevant. Money could not save your life. Only design could. Rapidly designed masks, shelters, hospitals, instructional posters, infographics, dashboards, respirators, sanitisers, virtual and local communities emerged to save us. From January 2020, design became king. The Covid-19 global pandemic presented an ontological reality; design is more than margins or profit. In fact, design became extremely valuable when it stopped concentrating on those things and started to care about peoples' lives. This brief episode in history is repositioning the status of design and reconfiguring its signifier from consumption to care.

In a recent interview for Design Emergency - a project that explores design's role and impact on the COVID-19 crisis and its aftermath - Alice Rawsthorn interviewed Dries Verbruggen, co-founder of Creatives tegen Corona (Creatives against Corona), "a collaborative network in Antwerp, started in response to the urgent need for personal protective equipment by Belgian health and social care workers in the Covid-19 crisis..." (Rawsthorn, 2020). Creatives tegen Corona used volunteers and created a not-for-profit company to deal with the situation by creating garments with donations, collaborated with a multiplicity of experts, and made their designs open-access. No money. No profit. No margins. Only caring for others. This is an example of how design excels and illustrates what design can be. If the inter-period between world wars repositioned economics from the margins to centre-stage, this crisis, which is not an economic crisis, but a design crisis, could reposition design from the margins to centre-stage.

INTRODUCTION I3

However, this should not come as a surprise. Design's turn from the overtly commercial to a wider social agenda is not new. Design has long despised its profitmaking and wasteful nature articulated by key figures such as Victor Papanek (Papanek, 1985), Ken Garland (Garland et al, 1964) and, more recently, by Anthony Dunne and Fiona Raby (Dunne, 2005) who argue for design that makes us think instead of making us buy. Design researcher Matt Malpass presents a multitude of design practices in the emancipatory-social-science spectrum such as Associative Design, Co-design, Transition Design, the aforementioned Speculative and Critical Design, Design Fiction, Design Activism, Socially Responsible Design, Participatory Design, Meta-Design, Transformation Design, Conceptual Design, Post-industrial Design, Social Design, Open Design, Design as Politics, or Sustainable Design (Malpass, 2017: 9).

In his critical paper, "On Design and Disillusion", Silvio Lorusso highlights the recent rise in labels like "social design", "critical design", and "speculative design" and how each of these iterations contributes to a spectacle of design super-heroes versus societal problems - packaged in events like the Dutch What Design Can Do, a platform created to "...demonstrate the power of design; to show that it can do more than make things pretty. To call on designers to stand up, take responsibility and consider the beneficial contribution that designers can make to society." (Lorusso, 2019: 110).

Whilst there is mileage in Lorusso's argument that design loves a challenge such as the "refugee challenge" or the "climate change challenge" where design positions itself as "...the ultimate problem-solving discipline", superior to governments or NGOs..." where "...global tragedies become design opportunities", there can be no doubt that the 500+ projects documented in this book are legitimately aiming to make things better for people.

We also consider this book to be one more of the 500+ projects we have assembled. It is a design response to the Coronavirus pandemic because we could see the need to collect all this material and assemble it as a durable record for all time because "...we need to learn to live in a world that is

I4 INTRODUCTION

interconnected not only ethereally or ideally, through communication technologies, but also materially, via direct embodied contact. In short, we must learn to live in a reality that may, at any moment, go viral." (Marder, 2020).

In this context, Bruce Archer went some way in 1978 to proposing design as a third culture of thinking. This approach was deepened by Nigel Cross in his seminal paper *Designerly Ways of Knowing*. Building on Archer's work at the Royal College of Art, he describes this third culture as: "...the collected experience of the material culture, and the collected body of experience, skill and understanding embodied in the arts of planning, inventing, making and doing." (Cross, 1982: 221). This is exactly what we have done in this book.

While leaderships were floundering, design (together with volunteers and the general public) was at the forefront of stepping in and sorting out many of the most significant problems during the Covid-19 crisis. Very obviously, planning, preparedness, readiness, and appropriateness, which are fundamental characteristics of design, were found wanting when many country's carefully-constructed and trialled global pandemic plans were put into action. As Lydia H. Liu asks: "...how do we end up in a state of unpreparedness in the midst of advanced preparedness?" (Liu, 2020) One answer presented endlessly by a critical media was that the Capital Project's search for maximum profit appeared to have undermined many countries' public health system's crisis capacity. The voids in pandemic plans enabled a space for potential interventions and, since there was nothing in place, design stepped up and stepped up very visibly. This book maps this response to build preparedness and to build a case for just how important to governance design and care are. From the massive number of cases assembled in this book, governments should have no choice but to recognise design's capabilities and integrate designers into an expanding concept of lasting care.

Every project in this book attempts to fill the shameful gaps left by the Capital Project when it extracted preparedness from the balance sheets of the world's healthcare systems. In what was beginning to look like an

INTRODUCTION I5

unthinkable-world, these design projects care for people who clearly had both thinkable and previously unthinkable needs. As Joan W. Scott (2020) describes "The pandemic has exposed yet another of the fault-lines of our moment: the difficulty of imagining ourselves beyond the current worlds in which we live." (Scott, 2020) The ability to imagine possible futures or future possibilities or what-might-become is the historic territory of design, the designer, and the act of designing. Or at least it used to be. But as Franco 'Bifo' Berardi maintains we were already living through the 'slow cancellation' of the future where what-might-become is morphing into what-might-not become (Berardi, 2011).

This temporal contest – present versus future – is also a mental space occupied by administrations as Mike Davis points out: "On the same day that the president was bragging of the United States' unmatched scientific and technological superiority," the New York Times was devoting a page to "How to Sew a Mask at Home." (Davis, 2020b) Again, Joan W. Scott broadens this temporal contest when she compares past and future: "Sometime in the twentieth century, we lost our belief in the redemptive power of history and so in the guarantee of a better future." Again, this resonates strongly in the world of design where many seem to ignore or are ignorant of historical accounts of design[ing] and fall into the trap of reinventing the wheel. By compiling this impressive and comprehensive response to Covid-19, we partly redeem some of design's temporal confusion – seeing no future in the past, locked in an imitative loop in the present while imagining it is designing the future. A response of this magnitude, showing what design can do, also partly redeems design's unwillingness to take responsibility for what design does. And prior to design's response to the Covid-19 crisis the state of design might best have been described as being trapped in a number of paradoxes – sustaining the unsustainable, disciplining the undisciplined, reconciling future visions with harsh realities, and others (Rodgers et al, 2017). In the case of the coronavirus pandemic, the context is paradoxical (combating an invisible enemy) and we have had to make many undesirable choices (e.g. lock down or die!). But dilemmas are what design confronts constantly in practice. For instance, the contradiction of designing a tracking system to help, but which implies invading somebody's privacy.

The Covid-19 design responses acknowledge our material and energy flows and environmental impact and contests the legitimisation of power – to respond is to be responsible and many governments are being criticised for their irresponsible response. As we have said, and as the 500+ interventions in this book show, design has proved that in a crisis it cares.

It is possible that all of this, both the known and the unknown, must have been chronicled in non-stop media coverage. But like the contents of this book some of this can be analysed. The website “Coronavirus Readings” (URL is in the references) allows users to “...browse and search a wide range of analysis and commentary relevant to COVID-19 - across text, video and audio in multiple languages”. At the time of writing there were over 12,500 contributions. Half were produced in English and the rest in seven other languages. Journalism makes up 90% of the database. It already lists two books (to the best of our knowledge there are already 5 books). The topic ‘future’ makes up only 3.5% of the readings, which doesn’t seem to align with the vast amount of journalism competing to predict the effect of the pandemic as the long-awaited opportunity to think and do everything anew – what is dubbed the new normal. This output aligns with our research, where most of the work included was discovered by searching the specialist blogosphere coverage of the event. Their agility and connectivity provided an in-the-moment space for enquiry. In contrast to the relentless media speculation competing to project both evermore worse or forever better future scenarios, this book functions as a ‘history’ – a history of the design reaction to Covid-19.

This book is organised in a pure chronological order as a history of design interventions. We have listed everything chronologically – day-by-day from 1st of January 2020 to 31st May 2020 inclusive. This temporal span, based in the UK, encompasses the outbreak of the virus, the lockdown period, and the reopening. Accounting for 500+ design interventions in total. These interventions are a record of places, dates, embodiments and strategies by which to extract knowledge. The proposed chronological structure operated as a type of index system that we have operationalised by articulating several graphic organisational frameworks enables projects to be cross-referenced

and compared. By using chronology to frame the assembly of this book we uncover evolutive traces. For instance, posters are first instructional, then emotional, and then they become political. In terms of Personal Protective Equipment (PPE), we observed transparent masks becoming simplified over time. The first models were complex and 3D-printed. The latest models are a sheet of plastic with 2 holes and a band, thereby removing the need for 3D printers, and enhancing production and sustainability in the process. Furthermore, we have discovered how at the beginning of this crisis, due to a shortage of products, it was a combination of professionals, individuals, groups and communities that stepped forward to fill the gaps left by errant public policy, planning and preparedness. We witnessed that once the systems of production adapted and started to produce/import those goods, the civil production of initiatives/goods decreased in cycles in different countries. We also discovered that this was true for the West. In the East, everything was produced by the state.

Slavoj Žižek (2014) would classify the virus as: “...an event at its purest and minimal: something shocking that happens all of a sudden and interrupts the usual flow of things; something that appears out of nowhere, without discernible causes, and whose ontological status is unclear – an appearance without solid being as its foundation”. As a “history of...”, an assembly of what design did between 1st January and 31st May 2020, this book does what Žižek defines as to de-eventalize the event. That is, to explain it as an occurrence that fits the coordinates of our normal reality. Because this is what this book is - an ontology of design. It aims to understand what has happened. This typology will complement traditional epistemological models focusing on how we did it.

One gets a slightly different picture when Mike Davis, who painted the complete picture of global pandemics in his 2005 book, “The Monster at the Door”, launches yet another of his denunciations of the global disbelief with a line: “So Corona walks through the front door as a familiar monster.” As an organising system, chronology allows us to transverse the familiar and the unexpected dimensions of the pandemic event. A design ‘history of...’ the pandemic is also reliant on the history of design, which helps comprehend

some of the darker aspects of pandemic behaviour. Under the murky banner of Black Design, the radical designers in Italy in the 1970s prefigured design's entanglement with unthinkable events with designs for death and dying (Mendini, 1983). In the hands of the radical designers, Black Design was a critique of the barbarism of mass-consumption. In contrast one unthinkable event resulting from the pandemic was a scoring card system released to determine who should live and who should die. Even the thought of this calculation is a type of design; a black design that defies every notion of care illustrated here.

Now we know that things can be otherwise. In this book, the interesting thing is that we have been able to build arguments. For example, we are finding that biological tests are the best solution (they range from kits to dogs sniffing – a kind of interspecies design), and that tracing apps are dangerous and irrelevant. What is fascinating is that all the technologists who wanted to save the world have totally disappeared. Where are they? Sending boxes of useless stuff all over the planet or sending rockets to Mars while sending governments a fraction of their taxes?

In line with what Joan W. Scott describes (citing Foucault) as the relationship between critical thinking and protest as insubordination – "...not like that, not for that, not by them...". Of the 500+ design cases that we have collected and present in this book, many of these are forms of protest. Here, the designed interventions are often designed, manufactured, and distributed by small groups of design activists and/or by individuals who have responded in the face of almost total neglect from our political leaders.

The contents of this book cover the outbreak, lockdown, and the beginning of the reopening in the UK. In between, the book functions as a history of pandemic crisis design interventions. As such it is a "research-in-the-moment project" where we illustrate our thoughts and insights in tables, charts and diagrams. We have accepted all design interventions as valid and gave them the same role and status by presenting each of them on a single page. No curation. No selection. No position. The task of critical analysis must follow – perhaps by us, certainly by others. At this stage of the Coronavirus pandemic,

where this book is an integral project of response/protest, any attempt to designate or distinguish or select projects will promote a notion of a "good design" and by default demote the rest. This is a typical approach applied by the museum sector concerned with the classification of types. Already some of the projects collected here are finding their way into the time capsules of museums via projects like Pandemic Objects at the V&A, London. In contrast to these archival practices, the rapid spread of the pandemic around the globe mirrors the fluid global information flows. Only when the viral chronicling ends will critical analysis of design's response to the coronavirus be applicable. Only then will we be able "...to think about these social ills, and so, about what might constitute a cure for them that the pandemic has so glaringly exposed." (Scott, 2020).

The 500+ design projects we have collected have been formatted chronologically into a range of highly informative tables, charts, timelines and images including the following:

- Chronological development, frequencies of interventions and type.
- Categorical analysis, type and impact
- Relational developments among categories, embodiments and enablers
- Relationships among typologies, phases (outbreak, lockdown and reopening) and time
- Geographical developments and typologies
- Weighted hierarchical analysis of interventions and places
- Flow developments
- Product/ service/ system/ environment typologies evolution
- Development rationale and dynamics
- Aims/ needs/ worries/ concerns/ challenges

As Fred Block acknowledges "This is not the last pandemic we will face" (Block, 2020). In the likely event of a second wave, and/or other pandemic or emergency events, these insights lead a case to build preparedness for such circumstances. This framework identifies key categories/ needs/ worries/ concerns and challenges. It also highlights the important roles that design, designing, and designers might play.

Before the projects catalogued in this book, design was certainly paradoxical (Rodgers et al, 2017) and this is the context from which design designed its way through the Covid-19 crisis. Despite this successful exit by design from a list of binding paradoxes, new dilemmas are now emerging. As a result of all the design projects assembled here, design must now make some challenging choices. Will it go back to being the handmaiden of Capital or abandon Capital to build on what it has achieved? For example, care and community, while aiming for even bigger targets such as inequality and the climate emergency, etc. That is, a new human condition? And the paradoxes inevitably also become dilemmas - after the crisis, which way will design go? If design chooses the hard route - the unknown knowns (Rodgers and Bremner, 2019; Žižek, 2006) - then what do the projects in this book indicate about how to design?

In the midst of the quarantine in Italy, Franco 'Bifo' Berardi wrote: "Use value, long expelled from the field of the economics, is back, and the useful is now king." The 500+ design projects here add up to a history of the Covid -19 crisis and we expect much of what is illustrated will disappear - so more than likely, as a document, this book will be extremely useful forever.

Paul A. Rodgers, Craig Bremner, and Fernando Galdon

**A
DESIGN
HISTORY
OF THE
COVID-19
VIRUS**

1

DIARY

DATA COLLECTION

Given the very peculiar coronavirus lockdown circumstances to assemble this book we simply collected everything as a type of diary entry form of data collection. We saw it as the best possible method to gather the collected experience of the material culture, body of experience, skill and understanding embodied in the arts of planning, inventing, making and doing related to the event. Also, the infinite array of digital tools enabled us to collect the interventions from our desks. In this context, photos, videos and text were collected using a variety of online apps and tools that allowed us to collect the design interventions dealing with an unexpected event. Here we are not investigating how people changed over time, but how practice, in this case design, adapted through time and circumstances to address readiness, appropriateness and preparedness.

In this book we are using what could be characterized as an elicitation perspective. It consists of capturing media as soon as the phenomenon occurs to record examples of pandemic design as soon as they were found in the digital landscape.

In order to frame the intended outcome, a progressive and systematic integrative review has been conducted. It was decided to use this approach to insert flexibility into the cataloguing of the event. The search criteria were articulated based on their relevance to the subject. Design blogs, and specialist websites were searched daily. These online sources articulated the views of relevant and amateur practitioners. We also included reports from news platforms to complement and expand data collection to insert a broader and more inclusive and representative perspective. The criterion for inclusion was the relevance to the practice of design.

The selection was conditioned by our searches; therefore, it was arbitrary. The cases collected in this book represent a sample data of the event. The date represented in the cases is an estimation. Online tools such as scraping data tools were used to determine the date of publication. However, as the tool in itself claims, is just an estimation. In cases where we could not determine the data, we used the day it was encountered. We were not

interested in documenting what happened with exactitude. This work belongs to sociologists and anthropologist. Rather, we were interested in documenting a sample of data to extract high patterns of knowledge to build 'knowledge for future actions' (Glanville, 2015). The table below is an example table of the information we collected from each case;

Title	COVID-19 Coronavirus Map: Global Outbreak Dashboard

Description	The virus has infected more than 2,843,000 people in at least 177 countries.
Country	USA

DATA ANALYSIS

As design researchers we are concerned with extracting and identifying patterns of activity emerging from the collected experience of the material culture, and the collected body of experience, skill and understanding embodied in the arts of planning, inventing, making and doing in the artificial world, to infer knowledge for future actions in the context of appropriateness.

We have documented this event as it evolved every day from the 1st of January 2020 to 31st May 2020 and we selected the cases in this book from the point of view of design. This temporal span encompasses; the outbreak; the lockdown and the reopening. Accounting for 500+ interventions in total. These interventions are a record of places, dates, embodiments and strategies and the proposed chronological structure operated as a type of index system, which we have operationalised by articulating several graphic organisational frameworks enabling projects to be cross-referenced and compared. We have accepted all design interventions as valid and gave them the same role and status by representing each of them in a single

page. No curation. No selection. No position. Just recording.

The classification of the interventions into categories emerged in the process of collecting. There was no preliminary hypothesis as nobody was expecting this event to happen. Furthermore, there was no reference in the field of design research in how to conduct or catalogue pandemic design. The classification of cases into categories and subcategories presented challenges. What is the ontological nature of a mobile test unit? Is it a product, a service, a tester, a system, a shelter, or an action? This kind of complexity led to a dynamic categorization of prospective initiative. The classification process was executed in the moment, therefore was influenced by contextual elements and personal interpretations and judgements. This aspect may provide variability in the assessment. However, as stated earlier, we are not so much concerned with exactitude, but recollection to underpin emerging patterns for future actions. Different variables were assigned to each case as they were collected.

Once we classified the cases and organised them into subsets, we could implement categorical analysis to underpin evolutive traces in specific categories or subcategories. Then, we colour coded the different variables in the subset to understand its evolution. This process enables preliminary understanding to generalize data patterns.

The example represented below illustrates how we operated the actions category. We colour coded the four subcategories and we could then trace dominant subcategories in longitudinal trajectories. We could observe how portals dominated the first part of the event, and hackathons the upper middle part of the spectrum. Specifications emerged in the latest part of the longitudinal spectrum. Competitions, are more or less evenly distributed, and are placed in the lower middle part, by dominant displacement.

From this point we were able to organise graphic material in a chronological way to further analyse its evolution. By using chronology to frame the assembly of this book we uncovered evolutive traces; for instance, posters are first instructional, then emotional, and then they became political. In terms of Personal Protective Equipment (PPE), we observed transparent masks becoming simplified over time. The first models were complex and 3D printed. The latest models are a sheet of plastic with 2 holes and a band, thereby removing the need for 3D printers, and enhancing production and sustainability in the process. Furthermore, we have discovered how at the beginning of this crisis, due to a shortage of products, it was a combination of professionals, individuals, groups and communities that stepped forward to fill the gaps left by errant public policy, planning and preparedness. We witnessed that once the systems of production adapted and started to produce/import those goods, the civil production of initiatives/goods decreased in cycles in different countries. This process presents a design-led alternative to pure statistical and mathematical models.

FRAMEWORK

In design research we trade some degree of accuracy in order to access areas that are yet-to-be or not-fully-formed. Therefore, our output is probabilistic, and research is always preliminary in its nature (Galdon, 2019). Moreover, in exchange we provide guiding knowledge for prospective developments – as Glanville proposed, 'knowledge for' future action and possibilities rather than 'knowledge of' past actions and events (Glanville, 2005). Design research is directional and transformational at its core. In this

context, we are more concerned with how things "ought to be" (Simon, 1995, pp.111-167) instead of how things actually are. Consequently, output is based on potentialities, not certainties. In the same way, history is not about facts, but rather about approximations which are updated as new information emerges. In this context, as the life of the intervention is placed into the future, the time required to assess the impact of the design is extended during its lifetime. Validation is always a posteriori, and the proposed output becomes the main element to be assessed. In this context transferability becomes crucial.

Transferability is defined as "The ability to apply the results of research in one context to another similar context. Also, the extent to which a study invites readers to make connections between elements of the study and their own experiences" (Barnes et al., 2020). The framework presented in this book is potentially transferable to other pandemic events. This aspect is very relevant since the rate at which novel viruses are emerging means other pandemics and emergency events will occur. It is clear the world will need to build preparedness for such circumstances. However, in this book we illustrate the ingenuity practicality and willingness of designers also generated a range of dilemmas and paradoxes to consider. Therefore, this framework identifies key categories and needs/, but also, worries, concerns and challenges.

Megathread for COVID-19 discussion

Thread Rationale

1. - Pandemic news is of general importance, but of tangential relevance to biohacking in most cases.. 2 - SARS was major world news for 18 months. MERS has had three notable outbreaks from 2012 to 2018. There's no particular reason to expect news to abate anytime soon.. 3 - Aiming to keep coronavirus discussion to one thread limits spam without forcing an outright ban on the topic.

Don't touch your face

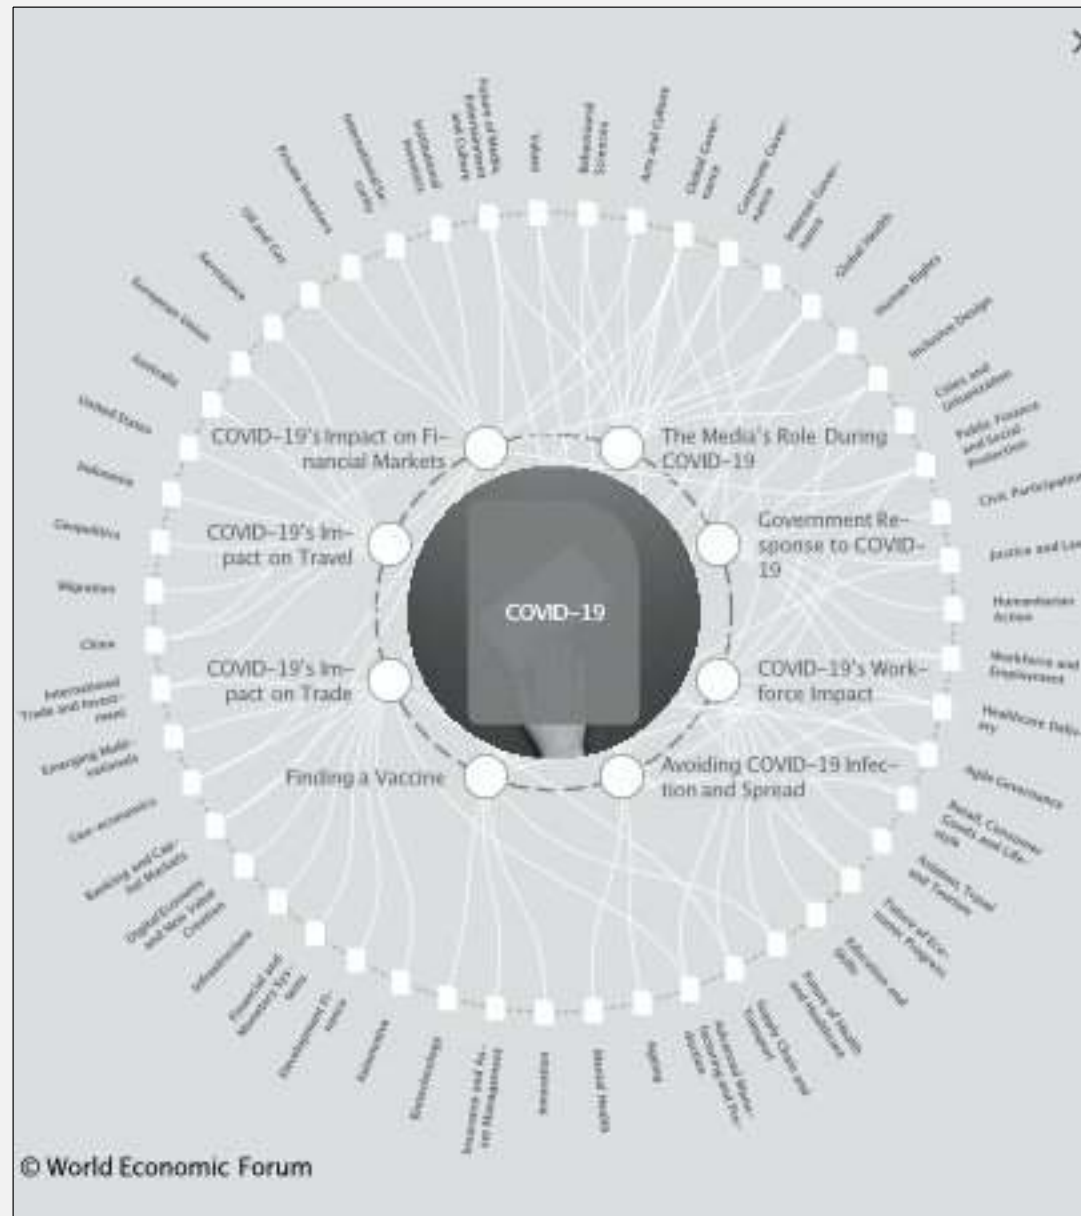

"Avoid touching your eyes, nose and mouth" after washing your hands or using hand sanitizer (assuming you can find hand sanitizer anywhere). This is easy to say, hard to do. This device (sort of like a watch) attaches to your wrist using a rubber band. When your arm rises in a "face touching direction," a tilt switch activates a buzzer to let you know that your hand is trying to get you into trouble.

<https://www.instructables.com/id/Dont-Touch-Face/>

COVID-19 threatens to become one of the most difficult tests faced by humanity in modern history. The International Monetary Fund says the global economy now faces its worst downturn since the Great Depression, and Oxfam International has warned that half a billion people could be pushed into poverty as a result of the unfolding crisis. Around the world, desperate efforts are underway to contain what has become a profoundly disruptive outbreak.

<https://intelligence.weforum.org/topics/a1G0X000006O6EHUA0?tab=publications>

The main actions coordinated by the Head of the Department are aimed at the rescue and assistance of the population potentially affected by the infection, the strengthening of controls in airport and port areas, in continuity with the urgent measures already adopted by the Ministry of Health, on returning to Italy of citizens who are in countries at risk and the return of foreign citizens to countries of origin exposed to risk.

Share facts about COVID-19

Know the facts about coronavirus (COVID-19) and help stop the spread of rumors

FACT 1

Diseases can make anyone sick regardless of their race or ethnicity.

Fear and anxiety about COVID-19 can cause people to avoid or reject others even though they are not at risk for spreading the virus.

FACT 2

For most people, the immediate risk of becoming seriously ill from the virus that causes COVID-19 is thought to be low.

Older adults and people of any age who have serious underlying medical conditions may be at higher risk for more serious complications from COVID-19.

FACT 3

Someone who has completed quarantine or has been released from isolation does not pose a risk of infection to other people.

For up-to-date information, visit CDC's coronavirus disease 2019 web page.

FACT 4

There are simple things you can do to help keep yourself and others healthy.

- Wash your hands often with soap and water for at least 20 seconds, especially after blowing your nose, coughing, or sneezing; going to the bathroom; and before eating or preparing food.
- When in public, wear a cloth face covering that covers your mouth and nose.
- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.

FACT 5

You can help stop COVID-19 by knowing the signs and symptoms, which can include:

- Fever
- Cough
- Shortness of breath

Seek medical attention immediately if you or someone you love has emergency warning signs, including:

- Trouble breathing
- Persistent pain or pressure in the chest
- New confusion or not able to be woken
- Bluish lips or face

This list is not all inclusive. Please consult your medical provider

Brian Stauffer, The New Yorker

Trump refusal to acknowledge the problem

On Wednesday, in response to criticism about his Administration's response, President Trump held a press conference addressing the epidemic. His performance—as Brian Stauffer's cover for this week's magazine suggests—was not entirely persuasive. "We're doing really well," Trump said. That day, the Centers for Disease Control and Prevention announced that it had identified, in California, the first U.S. case that had not been contracted from travel abroad, and stocks continued to tumble worldwide

Why Soap Works

At the molecular level, soap breaks things apart. At the level of society, it helps hold everything together. Soap is made of pin-shaped molecules, each of which has a hydrophilic head — it readily bonds with water — and a hydrophobic tail, which shuns water and prefers to link up with oils and fats. These molecules, when suspended in water, alternately float about as solitary units, interact with other molecules in the solution and assemble themselves into little bubbles called micelles, with heads pointing outward and tails tucked inside.

MASK

Glature

The nanobreeze works by using a built-in fan

Nanobreeze’ uses a rechargeable lithium battery that powers a built-in electric fan to effectively remove PM2.5 particles from the air. this filters air through a replaceable high-performance nanofiber filter which lasts approximately one week in high-pollution areas and three weeks in mildly-polluted areas. users can control the amount of air circulated in the mask via two modes: normal and power. normal can be used day-to-day and power mode can be used during exercise so That wearers can enjoy clean air without feeling short of breath.

Elbow Sock

Sneezing and coughing into your elbows and not into your hands is one piece of the advice to avoid getting and spreading the Coronavirus. As a reaction to this, Raw Color designed the Elbow Sock, a handkerchief for your elbows. It adds another layer to spare your clothes. An easy hack that everyone could apply. You simply look for that well-known single sock that lost its other half. Cut the toes off and slide it over your arm and you're good to go. After use you simply take it off and wash it at 60 degrees.

Makeshift face touch warner

I've been using it all day while working at my desk and it has warned me of touching my face several times. I got rid of false alarms while typing, mousing or handwriting by pointing the tilt switch slightly towards the outside (ulnar side) of my arm.

It consists of three main components; tilt switch, vibration motor, 3 V battery.

WEARABLE

Kim Binsted

It's hard not to touch your face. But now, there's an app for that

One of the simplest things you can do to prevent the spread of disease is often one of the hardest to remember: don't touch your face. Released first for the FitBit Ionic wearable fitness devices, JalapeNO! warns users any time they raise their hand to touch their face with a vibration. On average, office workers touch their faces 23 times per hour, with almost half involving contacts between hand and nose, eyes or mouth, Binsted explains. Her solution? Treat your hands as if you have been chopping jalapeno peppers for a family of seven billion people.

Joseph Richards

How many cases of COVID-19 does each U.S. state really have?

Reported U.S. case counts are based on the number of administered tests. Since not everyone is tested, this number is biased. We use Bayesian techniques to estimate the true number of cases.

<https://covid19dashboards.com/covid-19-us-case-estimation/>

I8
Mar

COVID-19 Case Estimates, by State

Definition Of Fields:

- **Reported Cases:** The number of cases reported by each state, which is a function of how many tests are positive.
- **Est Cases:** The predicted number of cases, accounting for the fact that not everyone is tested.
- **Est Range:** The 95% confidence interval of the predicted number of cases.
- **Ratio:** $\text{Estimated Cases} / \text{Reported Cases}$.
- **Tests per Million:** The number of tests administered per one million people. The less tests administered per capita, the larger the difference between reported and estimated number of cases, generally.
- **Cases per Million:** The number of **reported** cases per on million people.
- **Positive Test Rate:** The **reported** percentage of positive tests.

	Reported Cases	Est Cases	Est Range	Ratio	Tests per Million	Cases per Million
state						
NY	371711	400304	(382378, 434048)	1.1	108807.8	107107.6
NJ	100918	174522	(166684, 191562)	1.1	89672.5	18116.8
IL	121234	132501	(125234, 146517)	1.1	72465.7	9567.2
CA	113006	124349	(118987, 136478)	1.1	60835.7	2060.0

VALVE

Cristian Fracassi and Alessandro Ramaoli

Italian engineers and fabricators volunteer to rapidly 3D-print respirator valves

Facing a shortage of medical equipment in northern Italy, a team of engineers and fabricators has urgently 3D-printed 100 respirator valves for hospital patients suffering from COVID-19. The valves connect patients to breathing machines, providing a vital means of support. However, after a hospital in Brescia ran out of the devices, and the original manufacturer was unable to supply them, the team of volunteers — connected by Italian journalist Nunzia Vallini — took on the challenge of manufacturing new medical components.

COVID-19response: searching for emerging market ventilation systems

Hospitals around the world are grappling with COVID-19 and it is so complex. One of the challenges is making sure our hospitals have the equipment to treat people with respiratory problems.

In this context, ventilators are pivotal pieces of medical equipment. But there are not enough ventilators for the projected number of people who may be infected.

While engineering firms could consider switching to mass manufacturing to help with production of the vital equipment, parts of the air ventilators will still take too long to manufacture. That's where we're looking to emerging markets for Rapidly Manufactured Ventilation Systems (RMVS).

WHAT WE NEED: RAPIDLY MANUFACTURED VENTILATION SYSTEMS

We are looking for: innovative, proven technology that can be rapidly adapted to be built in the UK. The winning technology will be adapted for manufacture and use in the UK by a team at UCL Institute of Healthcare Engineering, with Global Disability Innovation Hub & GDI Hub. This design will then be shared with the world to support their fight against COVID-19.

WHAT YOU GET: OPPORTUNITY TO SUPPORT COVID-19 EFFORTS GLOBALLY AND A ROUTE TO MARKET IN THE UK AND BEYOND

We are offering the winning technology:

- Global recognition for your technology
- Support from a pre-qualified experts from University College London Institute of Healthcare Engineering and GDI Hub to support technology to be manufactured in the UK
- A free prototype or spare parts for the ventilator - to be determined
- And more...

UCL DESIGN & REFINE SPRINT: THURSDAY 19 MARCH - FRIDAY 20 MARCH 2020

UCL Institute of Healthcare Engineering and GDI Hub hosted a virtual, collaborative working group on Thursday 19 March - Friday 20 March. We invited participants with relevant, professional expertise as engineers, manufacturers, clinicians, or intensive care technicians to join us online for a Design & Refine Sprint. It was an opportunity to explore how existing designs and prototypes of low-cost ventilators could be adapted to fit different clinical environments (just as the NHS does the specific needs of intensive and Covid-19 bedside manufacturing at scale and at low-cost).

TIMELINE

- Launch: Monday 19 March (21:00 GMT)
- Close: Tuesday 24 March (09:00 GMT)
- Final Selection: Wednesday 25 March (09:00 GMT)

ADDITIONAL INFORMATION ABOUT THE SPRINT

There is a detailed list of requirements on the application form itself, with a quick overview provided below. The RMVS must:

OPEN CALL

Open solidarity

Technology has a role to play

For the duration of this healthcare crisis, many companies are working in solidarity with one another, to offer remote working, collaboration and healthcare hosting solutions. In light of the calls to action from local governments around the world, we encourage you to join #Open_solidarity. This initiative is an open, collective and global act of digital support — the aim of which is to provide technical solutions free of charge using OVHcloud infrastructures.

100 Million Mask Challenge

The journey begins with us. Learn how to get involved.

Thanks to an overwhelming response from our community, many individuals have volunteered to sew surgical masks for us. However, we're pleased to report that local manufacturing companies have stepped up to rapidly produce masks and face shields for us on a large scale.

We're also pleased to announce that the American Hospital Association has joined the cause and will facilitate support from manufacturers and the business community to help build up our supply of personal protective equipment. The AHA will connect manufacturers with hospitals, clinics and health systems in need of personal protective equipment.

Can you still help sew masks? There is a need and we would love your help.

Here's how you can help in the communities we serve:

[Alaska](#) [California](#) [Honduras](#) [Oregon](#) [Texas](#) [Washington](#)

A network of community-based organizations in Alaska, like homeless shelters and food banks, have reached out requesting a dire need for cloth masks. These cloth masks are needed for staff and for those they serve.

Here's a list of organizations that may be requesting this support:

[View Alaska list](#)

Other ways you can help

- Donate blood through the [DonorMail.org](#) (AA & UK). [DonorMail.org](#) (when it's available)
- Assist your neighbors, families and friends – Call a friend to check in on them. If you're able, consider picking up groceries, toys, games or books and leaving them at their doorstep. Be sure to use gloves and carefully wiped down any item with cleaning wipes to avoid any accidental transmission.
- Donate food and supplies to a local homeless shelter or food bank – Reach out to local agencies directly or visit their web page for more information about what donations they're accepting during this time. National organizations in need of support include: [Meals on Wheels](#), [Feeding America](#) and [Boys and Girls](#).

Estimating The Infected Population From Deaths

Estimating the number of infected people by country based on the number of deaths and case fatality rate.

What you can do to practically care for someone who is in their last days and hours of life

It is important to be aware of what to expect and how to make the experience as comfortable as possible.

Communication and environment

When approaching the end of life, people often sleep more than they are awake and may drift in and out of consciousness.

Try to imagine what the person you are caring for would want. Provide familiar sounds and sensations, a favourite blanket for example, or piece of music. Keep the environment calm by not having too many people in the room at once and avoid bright lighting. This can reduce anxiety even when someone is unconscious. Even when they cannot respond, it is important to keep talking to them as they can most probably hear right up until they die.

Feeling sick

Sometimes people can feel nauseated or sick when they are dying.

If vomiting, and unable to sit up, turn the person on their side to protect their airway. There are medicines that can be given to help relieve this.

Moving

The person will require washing at least once a day and regular turning every 2-4 hours to protect their skin from developing pressure sores.

Your health team will advise you on the medications that can help with controlling symptoms experienced at the end of life.

Pain

Some people may be in pain when they are dying. If they are less conscious they may grimace or groan to show this. There are medicines that can be given to ease pain.

Always check their positioning in bed to see if this can also help. They may be too weak to move and this can cause discomfort. Consider if they have any areas that are known to hurt, for example a bad back, and remember this when positioning them.

Going to the toilet

Towards the end of life, a person may lose control of their bladder and bowel. Even though we expect someone to go to the toilet less as they eat and drink less, contact the health care team that is looking after them if they have not passed any urine for 12 hours or more as it can be uncomfortable.

Keep the person comfortable by regularly washing them and changing pads if they are wet or soiled.

Mouth care

While people rarely complain of thirst at the end of life, a dry mouth can be a problem due to breathing mostly through their mouth.

Social Distancing Aids

In light of the Coronavirus and the need for varying degrees of social isolation, I have created this series of fantasy photos that suggest how we may be living in the near future, in an attempt to distance ourselves safely from one another. Although somewhat tongue in cheek, some version of my proposal may in fact have a certain degree of inherent practicality. These little structures I call Social Distancing Aids, would be made of lightweight plastic.

Josef Průša

How Prusa is using the world's largest 3D-printing farm to produce medical gear

'I don't intend to hamper the vibe we have now – not by a long shot, but printing respirators might not be the best idea at this time,' comments Josef Průša on the blog post. 'What are the key focus points? first, it's the sealing, then the filter itself, the filter to the mask, and how the mask attaches to the face – it all must be perfect.' He also questions the porosity of the printed parts and the safety concerns that come from that. 'I understand you're trying to help, but PLEASE spread this info into your 3D printing groups.'

Let's Fight Back To This Pandemic. Avoid the Scare.

After a spike in coronavirus cases, with everything that's happening about the Coronavirus, it might be very hard to make a decision of what to do today. Should you wait for more information? Do something today? What? One thing you learn in medicine is that we control ship and sail, but never wind and wave. We don't control everything, ever. Bad things happen to good people doing everything right all the time. So, the questions about coronavirus revert to questions about probability. So how can we prevent it? How can we be safe?

Mar

Prevent the spread of COVID-19 if you are sick

Accessible version: [https://www.cdc.gov/coronavirus/2019-ncov/downloads/sick-with-2019-nCoV-fact-sheet.pdf](#)

If you are sick with COVID-19 or think you might have COVID-19, follow the steps below to help protect other people in your home and community.

Stay home except to get medical care.

- Stay home. Most people with COVID-19 have mild illness and are able to recover at home without medical care. Do not leave your home, except to get medical care. Do not visit public areas.
- Take care of yourself. Get rest and stay hydrated.
- Get medical care when needed. Call your doctor before you go to their office for care. But, if you have trouble breathing or other concerning symptoms, call 911 for immediate help.
- Avoid public transportation, ride-sharing, or taxis.

Separate yourself from other people and pets in your home.

- As much as possible, stay in a specific room and away from other people and pets in your home. Also, you should use a separate bathroom, if available. If you need to be around other people or animals in or outside of the home, wear a cloth face covering.
- See COVID-19 and Animals if you have questions about pets.

Monitor your symptoms.

- Common symptoms of COVID-19 include fever and cough. Trouble breathing is a more serious symptom that means you should get medical attention.
- Follow care instructions from your healthcare provider and local health department. Your local health authorities will give instructions on checking your symptoms and reporting information.

If you develop emergency warning signs for COVID-19, get medical attention immediately.

Emergency warning signs include*:

- Trouble breathing
- Persistent pain or pressure in the chest
- New confusion or not able to be woken
- Bluish lips or face

*This list is not all inclusive. Please consult your medical provider for any other symptoms that are severe or concerning to you.

Call 911 if you have a medical emergency. If you have a medical emergency and need to call 911, notify the operator that you have or think you might have COVID-19. If possible, put on a face mask before medical help arrives.

Call ahead before visiting your doctor.

- Call ahead. Many medical visits for routine care are being postponed or done by phone or telemedicine.
- If you have a medical appointment that cannot be postponed, call your doctor ahead. This will help the office protect themselves and other patients.

If you are sick, wear a cloth covering over your nose and mouth.

- You should wear a cloth face covering over your nose and mouth if you must be around other people or animals, including pets (even at home).
- You don't need to wear the cloth face covering if you are alone. If you can't put on a cloth face covering (because of trouble breathing for example), cover your coughs and sneezes in some other way. Try to stay at least 6 feet away from other people. This will help protect the people around you.

Note: During the COVID-19 pandemic, medical grade facemasks are reserved for healthcare workers and some first responders. You may need to make a cloth face covering using a scarf or bandana.

DOORS OPENER

Ivo Tedbury and Freddie Hong

Architectural designers develop hands-free door handle to prevent spread of coronavirus

Architectural designers Ivo Tedbury and Freddie Hong have created a 3D-printed device that adapts door handles for hands-free opening, in a bid to help prevent the spread of coronavirus. Tedbury and Hong, who met while studying architecture at the Bartlett School of Architecture, designed a curved plastic device that attaches onto "fire escape-style" pull door handles via a pair of cable ties. The idea is that instead of opening the door with their hands, users loop their arm through the adaptor and pull the door open.

HACK THE CRISIS

Hack the Crisis: idea collection / Kriisihäkk: ideekorje

Introduction

ENG: Starting this evening Accelerate Estonia and Garage48 will host an online hackathon so that Estonia can emerge from the crisis stronger than ever. Now is the prime time to design, test and launch moonshot ideas that will either help tackle the crisis or position Estonia well for the aftermath.

Accelerate Estonia will sponsor up to 5 ideas with \$K for execution during the state of emergency and the full support of the minister for ICT and Foreign Trade, Mr. Kallel Rõõs. So what are we looking for? Ideas that are:

- providing a solution in 48 hours and help solve the crisis
- giving Estonia the edge in the post-crisis world.

Do not stop at anything. Think of moonshots. Think of stuff that needs different regulations. Submit your idea for all interested hackathon teams to pick it up and solve it. You can be part of the team as well.

EST: Jätku täna õhtul algab Accelerate Estonia ja Garage48 digitaalne väljakutse. Võitluse jaaniks võtta tegutseda ja Eestist kriisist tugevamini välja tuua. Nüüd on aeg mõelda ideid, mis aitavad maailma kriisiga toime tulla. Ideid, mis aitavad Eestil kriisist tugevamini välja tulla.

Accelerate Estonia toetab kuni 5 hoopevõistluse ideid \$5000 eestiga, et need arendada kriisi ajal. Kriisi ajal on Eestil vaja. Võitluse jaaniks võtta tegutseda ja Eestist kriisist tugevamini välja tuua. Nüüd on aeg mõelda ideid, mis aitavad maailma kriisiga toime tulla. Ideid, mis aitavad Eestil kriisist tugevamini välja tulla.

Disainime, testime ja jätame teile mõistatuse ideid. Otsime ideid, mis on 48 tunni jooksul lahendatavad ja aitavad kriisiga toime tulla. Ideid, mis aitavad Eestil kriisist tugevamini välja tulla.

Are teie meel tagasi. Mõelge, võitlege. Mõelge, lahendage, mis aitab maailma kriisiga toime tulla. Mõelge, lahendage, mis aitab Eestist kriisist tugevamini välja tulla. Mõelge, lahendage, mis aitab Eestist kriisist tugevamini välja tulla. Mõelge, lahendage, mis aitab Eestist kriisist tugevamini välja tulla.

MAR 26 - 30, 2020

18,000+ innovators from 175 countries created 1,560 projects to #BuildForCOVID19

The #BuildforCOVID19 Global Online Hackathon was an opportunity for global developers to come together and tackle challenges related to the coronavirus (COVID-19) pandemic.

Innovators around the world were encouraged to use technologies of their choice across a range of suggested themes and challenge areas—some sourced through health partners including the World Health Organization and scientists from the Chan Zuckerberg Biohub.

The hackathon welcomed locally and globally focused software solutions, with support from technology companies and platforms including AWS, Facebook, Giphy, Microsoft, Pinterest, Salesforce, Slack, TikTok, Twitter and WeChat, who shared resources to support participants throughout the submission period.

Highlighted projects

We consider every participant who dedicated their time and skills to #BuildforCOVID19 a winner. That said, our team of health & technical expert judges have spent the past week considering the viability, impact and potential of the projects submitted.

GOGGLES

Farsoon, Huaxiang & LEHVOSS Group

Farsoon, Huaxiang & LEHVOSS Group additively manufacture safety goggles to fight COVID-19

To prevent infection in highly contaminated hospital environments, medical workers who are in close contact with patients must wear personal protective equipment (PPE) including masks, gloves, and respiratory systems to prevent infections transmitted through the nose and mouth. In addition to the safety PPE equipment listed above, other critical protection equipment are safety goggles. These are just as important as masks in protecting medical personnel against infection.

COVID-19 SymptoTrack

SymptoTrack is a tool that works to map anyone with symptoms of COVID-19. By answering this questionnaire, you can record your own symptoms or those of someone else. We use this data to map the spread of the virus. SymptoTrack was developed by HIKE, Greenberry and Forest to help healthcare workers in their fight against the coronavirus.

<https://www.symptotrack.org>

SYMPTOTRACK

Like light from a distant star that takes years to reach our eyes, data from the NHS is a snapshot of infections that happened 10+ days ago. To know what's happening right now, this site uses an interactive model to estimate what happened during that time. The estimates are generated using a simple model of exponential growth. The goal of the model is intelligibility, allowing users to explore the data for themselves.

<http://whereisit.in.london/>

A simple Telefónica tweet, accompanied by a drawing, has served to recognize the priceless effort of the most admirable and demanded group of the moment. "Dedicated to all health personnel in Spain, and especially Madrid, in these difficult times. # GraciasHéroes", publishes the telecommunications company. The drawing is the creation of Niko Gómez Nicolás.

Mitigation calculation

The following tool can be used to calculate the estimated effect of various combinations of COVID-19 countermeasures. On the left, measures and measure groups can be toggled to factor into the calculation. On the right, the impact on growth is displayed using coloured bands. The impact estimates are based on our model combining a countermeasures dataset and their empirically observed growth reduction. The impact of each measure can be customized by the sliders to e.g. factor in non-compliance.

Times Magazine

What to Know and What to Do About the Global Pandemic

This issue explores our strange new normal—in China, where COVID-19 still casts a long shadow; in Europe, where health systems are struggling to weather extraordinary challenges; and in the U.S., where a mismanaged political response lulled many into a sense of security now shattered by school and work closures, lost wages and social separation. In words and images, these stories detail the disparate responses—medical, technical and personal—required to slow and halt COVID-19, and, most important, how we can all emerge on the other side.

This virus is driving us apart, but when it will be over, I'm sure we'll all be stronger together

In central Milan, spaces that until a month ago hosted advertising now convey messages to raise awareness of coronavirus. Milan is not my hometown: I moved here only four months ago, after almost 15 years of travel— years in which I didn't have a base and the only place I could call home was Castiglion Fiorentino (Tuscany), the town where I grew up. Milan is the city where most of my friends live, those I want to be around, with whom I want to dine at home in the evening and plan holidays, concerts, parties. I haven't seen them for almost a month.

Researchers modelling the spread of the coronavirus emphasise the importance of avoiding busy indoor spaces

A joint project carried out by four Finnish research organisations has studied the transport and spread of coronavirus through the air. Preliminary results indicate that aerosol particles carrying the virus can remain in the air longer than was originally thought, so it is important to avoid busy public indoor spaces. This also reduces the risk of droplet infection, which remains the main path of transmission for coronavirus

What you should know about COVID-19 to protect yourself and others.

<https://www.cdc.gov/coronavirus/2019-ncov/downloads/2019-ncov-factsheet.pdf>

What you should know about COVID-19 to protect yourself and others

Know about COVID-19

- Coronavirus (COVID-19) is an illness caused by a virus that can spread from person to person.
- The virus that causes COVID-19 is a new coronavirus that has spread throughout the world.
- COVID-19 symptoms can range from mild (or no symptoms) to severe illness.

Practice social distancing

- Buy groceries and medicine, go to the doctor, and complete banking activities online when possible.
- If you must go in person, stay at least 6 feet away from others and disinfect items you must touch.
- Get deliveries and takeout, and limit in-person contact as much as possible.

Know how COVID-19 is spread

- You can become infected by coming into close contact (about 6 feet or two arm lengths) with a person who has COVID-19. COVID-19 is primarily spread from person to person.
- You can become infected from respiratory droplets when an infected person coughs, sneezes, or talks.
- You may also be able to get it by touching a surface or object that has the virus on it, and then by touching your mouth, nose, or eyes.

Prevent the spread of COVID-19 if you are sick

- Stay home if you are sick, except to get medical care.
- Avoid public transportation, ride-sharing, or taxis.
- Separate yourself from other people and pets in your home.
- There is no specific treatment for COVID-19, but you can seek medical care to help relieve your symptoms.
- If you need medical attention, call ahead.

Protect yourself and others from COVID-19

- There is currently no vaccine to protect against COVID-19. The best way to protect yourself is to avoid being exposed to the virus that causes COVID-19.
- Stay home as much as possible and avoid close contact with others.
- Wear a cloth face covering that covers your nose and mouth in public settings.
- Clean and disinfect frequently touched surfaces.
- Wash your hands often with soap and water for at least 20 seconds, or use an alcohol-based hand sanitizer that contains at least

Know your risk for severe illness

- Everyone is at risk of getting COVID-19.
- Older adults and people of any age who have serious underlying medical conditions

A vast store of DNA is being used to study why the severity of symptoms for coronavirus varies so much. UK Biobank - which contains samples from 500,000 volunteers, as well as detailed information about their health - is now adding COVID-19 data. It is hoped genetic differences could explain why some people with no underlying health conditions can develop severe illness. More than 15,000 scientists from around the world have access to UK Biobank.

BADGE

UK Government

Health Secretary Matt Hancock is pictured with the CARE badge which was revealed yesterday

The badges have been in production since March 19 2020- four days before the UK went into lockdown - and are used to raise the public profiles of caregivers in the UK. They are normally distributed for free by organisations to their staff. Mr Hancock said the CARE badge would have 'practical consequences as well', including enabling care workers to attend priority shopping hours at supermarkets.

MASK

Manuel Echavarria

FOLD is a cheap and accessible DIY mask made using coffee filters

Panama-based industrial designer Manuel Echavarria shares his DIY coffee filter mask. Although as yet untested, FOLD intends to provide a last resort facemask that is cheap, easy to make, and uses readily available materials. FOLD aims to relieve the burden on high-end masks, leaving them for those who need them most. Manuel Echavarria’s design is cheap (costing less than 0.7 USD), accessible, easy to make, ergonomic, and even disposable.

Fangcang shelter hospitals: a novel concept for responding to public health emergencies

Fangcang shelter hospitals are a novel public health concept. They were implemented for the first time in China in February, 2020, to tackle the COVID-19 outbreak. The Fangcang shelter hospitals in China were large-scale, temporary hospitals, rapidly built by converting existing public venues, such as stadiums and exhibition centres, into health-care facilities.

Genomic epidemiology of novel coronavirus - Global subsampling

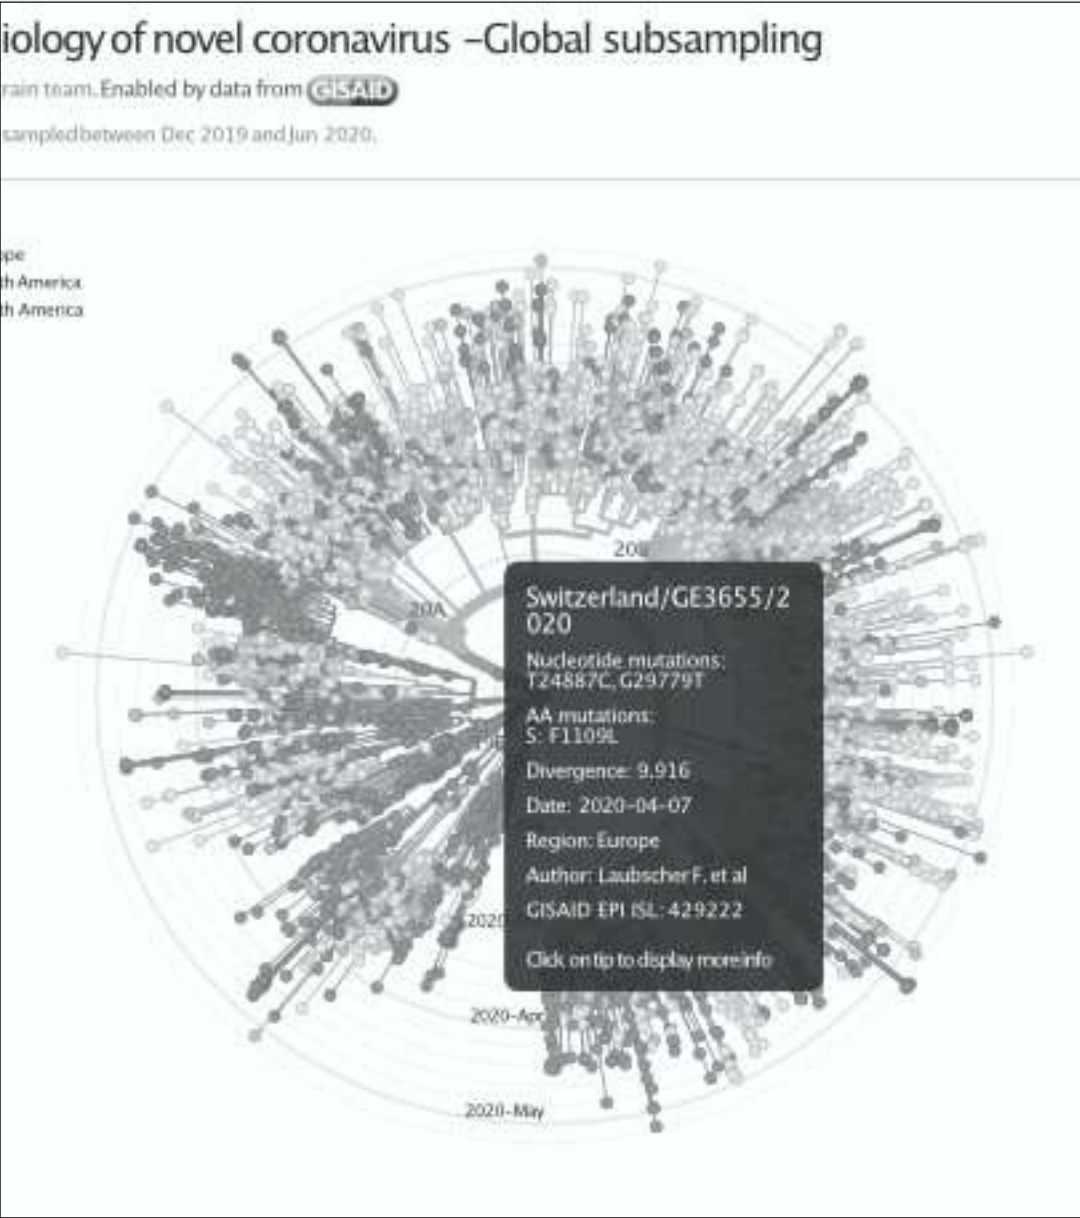

Nextstrain.org aims to provide a real-time snapshot of evolving pathogen populations and to provide interactive data visualizations to virologists, epidemiologists, public health officials, and community scientists. Through interactive data visualizations, we aim to allow exploration of continually up-to-date datasets, providing a novel surveillance tool to the scientific and public health communities.

<https://nextstrain.org/ncov?!=radial>

A Call for Action

The current pandemic has not only shown vulnerabilities in our public health systems but has also made visible our failure to re-use data between the public and private sectors — what we call data collaboratives — to inform decision makers how to fight dynamic threats like the novel Coronavirus. Here we call for action, and we propose the 7 actions to make data collaboration systematic, sustainable and responsible (and build the data infrastructure we need)

<https://medium.com/data-stewards-network/a-call-for-action-813669f32244>

CALL FOR ACTION

TOWARD BUILDING THE **DATA INFRASTRUCTURE AND ECOSYSTEM** WE NEED TO TACKLE PANDEMICS AND OTHER DYNAMIC SOCIETAL AND ENVIRONMENTAL THREATS

#data4covid19

7 ACTIONS TO MAKE DATA COLLABORATION SYSTEMATIC, SUSTAINABLE, AND RESPONSIBLE IN LIGHT OF COVID-19

The undersigned concerned individuals, all of whom have worked responsibly to harness the potential of data to address critical societal and environmental challenges, call upon major stakeholders to take seven key actions to unleash the potential of #datacollaboration in addressing the ongoing COVID-19 pandemic and to improve preparedness for the future.

JOIN US AND SIGN [HERE](#).

WHY WE NEED ACTION

The spread of COVID-19 is a human tragedy and a worldwide crisis. The social and economic costs are huge, and they are contributing to a [global slowdown](#). Despite the amount of data collected daily, we have not been able to leverage them to accelerate our understanding and action to counter COVID-19. As a result we have entered a global state of profound uncertainty and anxiety.

SHIELD

designlibero

'Bubble shield' by designlibero imagines a solar-powered personal space

For this project Libero Rutilo and Ekaterina Shchetina of designlibero have brought the phrase 'living in your own bubble' into manifestation. Developed in response to the COVID-19 pandemic and the need to limit the spread of the virus, the 'bubble shield' concept is essentially a physical barrier created to protect people in public spaces. We all live in our world and this 'bubble shield' concept proposes how the idea of a private protected zone could become physical.

Coronavirus: Man's ingenious solution to cuddle his grandma again goes viral

Antony Cauvin - a 29-year-old plasterer-turned-inventor from Stratford-upon-Avon, who dreamed up a scheme befitting of Back To The Future's Emmett Brown so that he could hug his grandma for the first time in months.

The "Cuddle Curtain" is made up of a see-through shower curtain, fitted with pairs of lengthy safety sleeves on either side so that two people can move effortlessly into place opposite one another.

MASK

Christian Warken

CALMEST is a face mask designed for doctors that spend multiple hours a day wearing a face mask!

The mask is constructed from a particularly breathable and highly dense material that can filter particles up to 0.1 microns (COVID-19 is ~0.13 microns). Through a transparent acrylic layer, the mask can help with better communication and recognition of facial expressions!

FT coronavirus updates "allow people to make an informed decision" says data visualisation journalist

First started "as a fairly scrappy rough chart" tracking coronavirus cases and deaths, the project has expanded to provide updates on responses by different countries, the effect of measures to mitigate the virus spread, like lockdowns, and economic impact. "Without data it would be very easy for governments to tell their own story"

TEST

Superdrug

£69 DIY antibody tests go on sale

Superdrug today became the first high street retailer to start selling a coronavirus antibody test to the public and has sold out in a matter of hours.

The tests, which are intended to tell someone if they have had the virus in the past, cost £69 and require the user to take blood samples themselves and post them off to a laboratory, where it takes 24 hours to produce a result.

Burger King

Is Burger King handing out giant crowns to ensure social distancing in Germany?

It seems that the fast food giant adopted the social distance crowns concept for a test run. Earlier today, on may 22, Burger King Germany posted on socials that some restaurants are handing out the crowns (folded and users have to make them themselves). 'We wanted to re-enforce the rules of high safety and hygiene standards that the BK restaurants are following,' a Burger King representative told business insider. 'The do-it-yourself social distance crown was a fun and playful way to remind our guests to practice social distancing while they are enjoying food in the restaurants.'

'Dropkick' is a handsfree pedestrian crossing button for a post pandemic world

When the team at foreward noticed the number of people using their feet to press the button at pedestrian crossings, they decided to develop a handsfree solution. After some research they found that the surfaces of these buttons are breeding grounds for bacteria, and with the current health pandemic sweeping the globe, this issue of public hygiene has never been so important. 'Dropkick' therefore rethinks this trivial yet integral part of urban infrastructure with a device that can be pressed by the users' foot.

Pandemic Problems – The RCA’s Helen Hamlyn Centre for Design Steps In

As the number of critically ill patients surged, speed was needed to help those most at risk. And, as the new Covid wards started to fill, countless NHS workers were redeployed to begin their work in these unfamiliar environments. Jonathan and his team, including HHCD Research Associates Juliette Poggi and Imran Nazerali, heard from NHS staff about the challenges they were facing, so the team started thinking about how design could help ease these problems.

'Incalculable loss': New York Times covers front page with 1,000 Covid-19 death notices

As the US approaches the grim milestone of 100,000 coronavirus deaths, the New York Times has filled the entire front page of Sunday's paper with the death notices of victims from across the country.

In a decision the paper said was intended to convey the vastness and variety of the tragedy, the front page is a simple list of names and personal details taken from obituaries around the US.

Italian gallery introduces tags to keep visitors 1.5 metres apart by vibrating and lighting up if they get too close

Electronic tags are being issued to visitors at a renowned art gallery in Italy after it reopened its doors to the public this weekend amid the coronavirus pandemic. The Accademia Carrara Museum in Bergamo, which opened its doors on May 22 after more than ten weeks in lockdown, has asked visitors to wear electronic tags to ensure they remain at least 1.5 metres away from others while inside.

SIMULATION

MSC

Infected Tube passenger showers coronavirus droplets over another person simply by TALKING to them in shocking simulation

In a simulation of Tube travel, produced by software firm MSC, one infected person can be seen literally coating other passengers with COVID-19 - just by talking. Researchers found that someone chatting to a friend on the tube can 'coat others' with the deadly coronavirus - even if they don't sneeze or cough. The new model looking at ways droplets from breath spread in enclosed spaces comes as Britain prepares to return to work, school and a level of normality after lockdown.

ROBOT

The University of Southern Denmark

Prototype robot that carries out throat swab tests for coronavirus using a disposable 3D-printed arm is developed by Danish researchers

A robot that is able to take throat swabs from coronavirus patients using a 3D printed arm was developed by a team of researchers from Denmark in just four weeks. The University of Southern Denmark says the world's first fully automated throat swab robot will be able to test the first COVID-19 patients by late June. Using disposable 3D printed parts, the robot holds a swab and hits the exact spot in the throat where a sample needs to be collected every time.

Waugh Thistleton Architects

Mobile vaccination centres in shipping containers could immunise 60 million people in four months

Waugh Thistleton Architects has proposed creating 6,500 mobile vaccination centres in shipping containers that could travel around the UK and immunise the entire population against coronavirus in 16 weeks. The units would allow the UK's stretched National Health Service (NHS) to roll out a mass immunisation programme should a vaccine for Covid-19 be found, the architect believes.

**A
DESIGN
HISTORY
OF THE
COVID-19
VIRUS**

FRAMEWORK

ENDPIECE

In response to the Covid-19 Virus the problems that design faced were highly complex, interdependent, and could not be addressed by conventional means, structures and research. As such the response illustrates comprehensively that when pressed we can find new ways of designing. What we witness in this book is what we might think of as a new model for designing. This new model does not describe a new condition to come after what we currently call design (who knows what that might be...). Unlike the structure of this book a new model for design is not a chronological idea. What we witness here is the revival of the practice of design – from handmaiden of Capital to Care – which is expressed in a new critical attitude for looking at the design world, probing its practice, its theoretical position and its product. At this stage looking at designing with care through the lens of critical theory we can only draw temporary conclusions. Time will continuously revise this history. But from what we have seen we can also foresee some critical issues that will need careful thinking, which we summarise below.

Designing with care concerns not only how we care for the world outside, but also how we care for ourselves or, rather, how we react to the way in which the world appears to care for us.

Designing with care is a new gesture for design. It might not be immediately clear to the designer what care actually is, and how the gesture is supposed to be performed. In order to start designing with care, we need a theory that explains what designing with care is. Such a theory could give us the possibility to universalise both design and care.

Designing with care, while we live in these strange and transitional times, is not necessarily transformational. Whereas transformation implies dramatic change, transition suggests a defined future state arrived at through some form of managed change. Whether change can be managed or not it will help if we define the future state rather than leave it to Capital or politics. In that sense a central promise of care is the possibility for transition to a better future. In transition to this possible future it must be asked whether we can continue to design with care and if so, what will we design?

ENDPIECE

Designing with care in the service enterprises economy is regulated to guarantee the delivery of care is consistent and viable. But care is like conversation theory, which maintains that conversation is constituted by the listener not the speaker. In the case of care – care is determined by the receiver not the provider. In this scenario, we must transition design from engagement to trust. The idea that trust is earned or built is a marketing project. Here we must shift orthodoxies of trust and reposition the relational gesture of care as granted by the receiver.

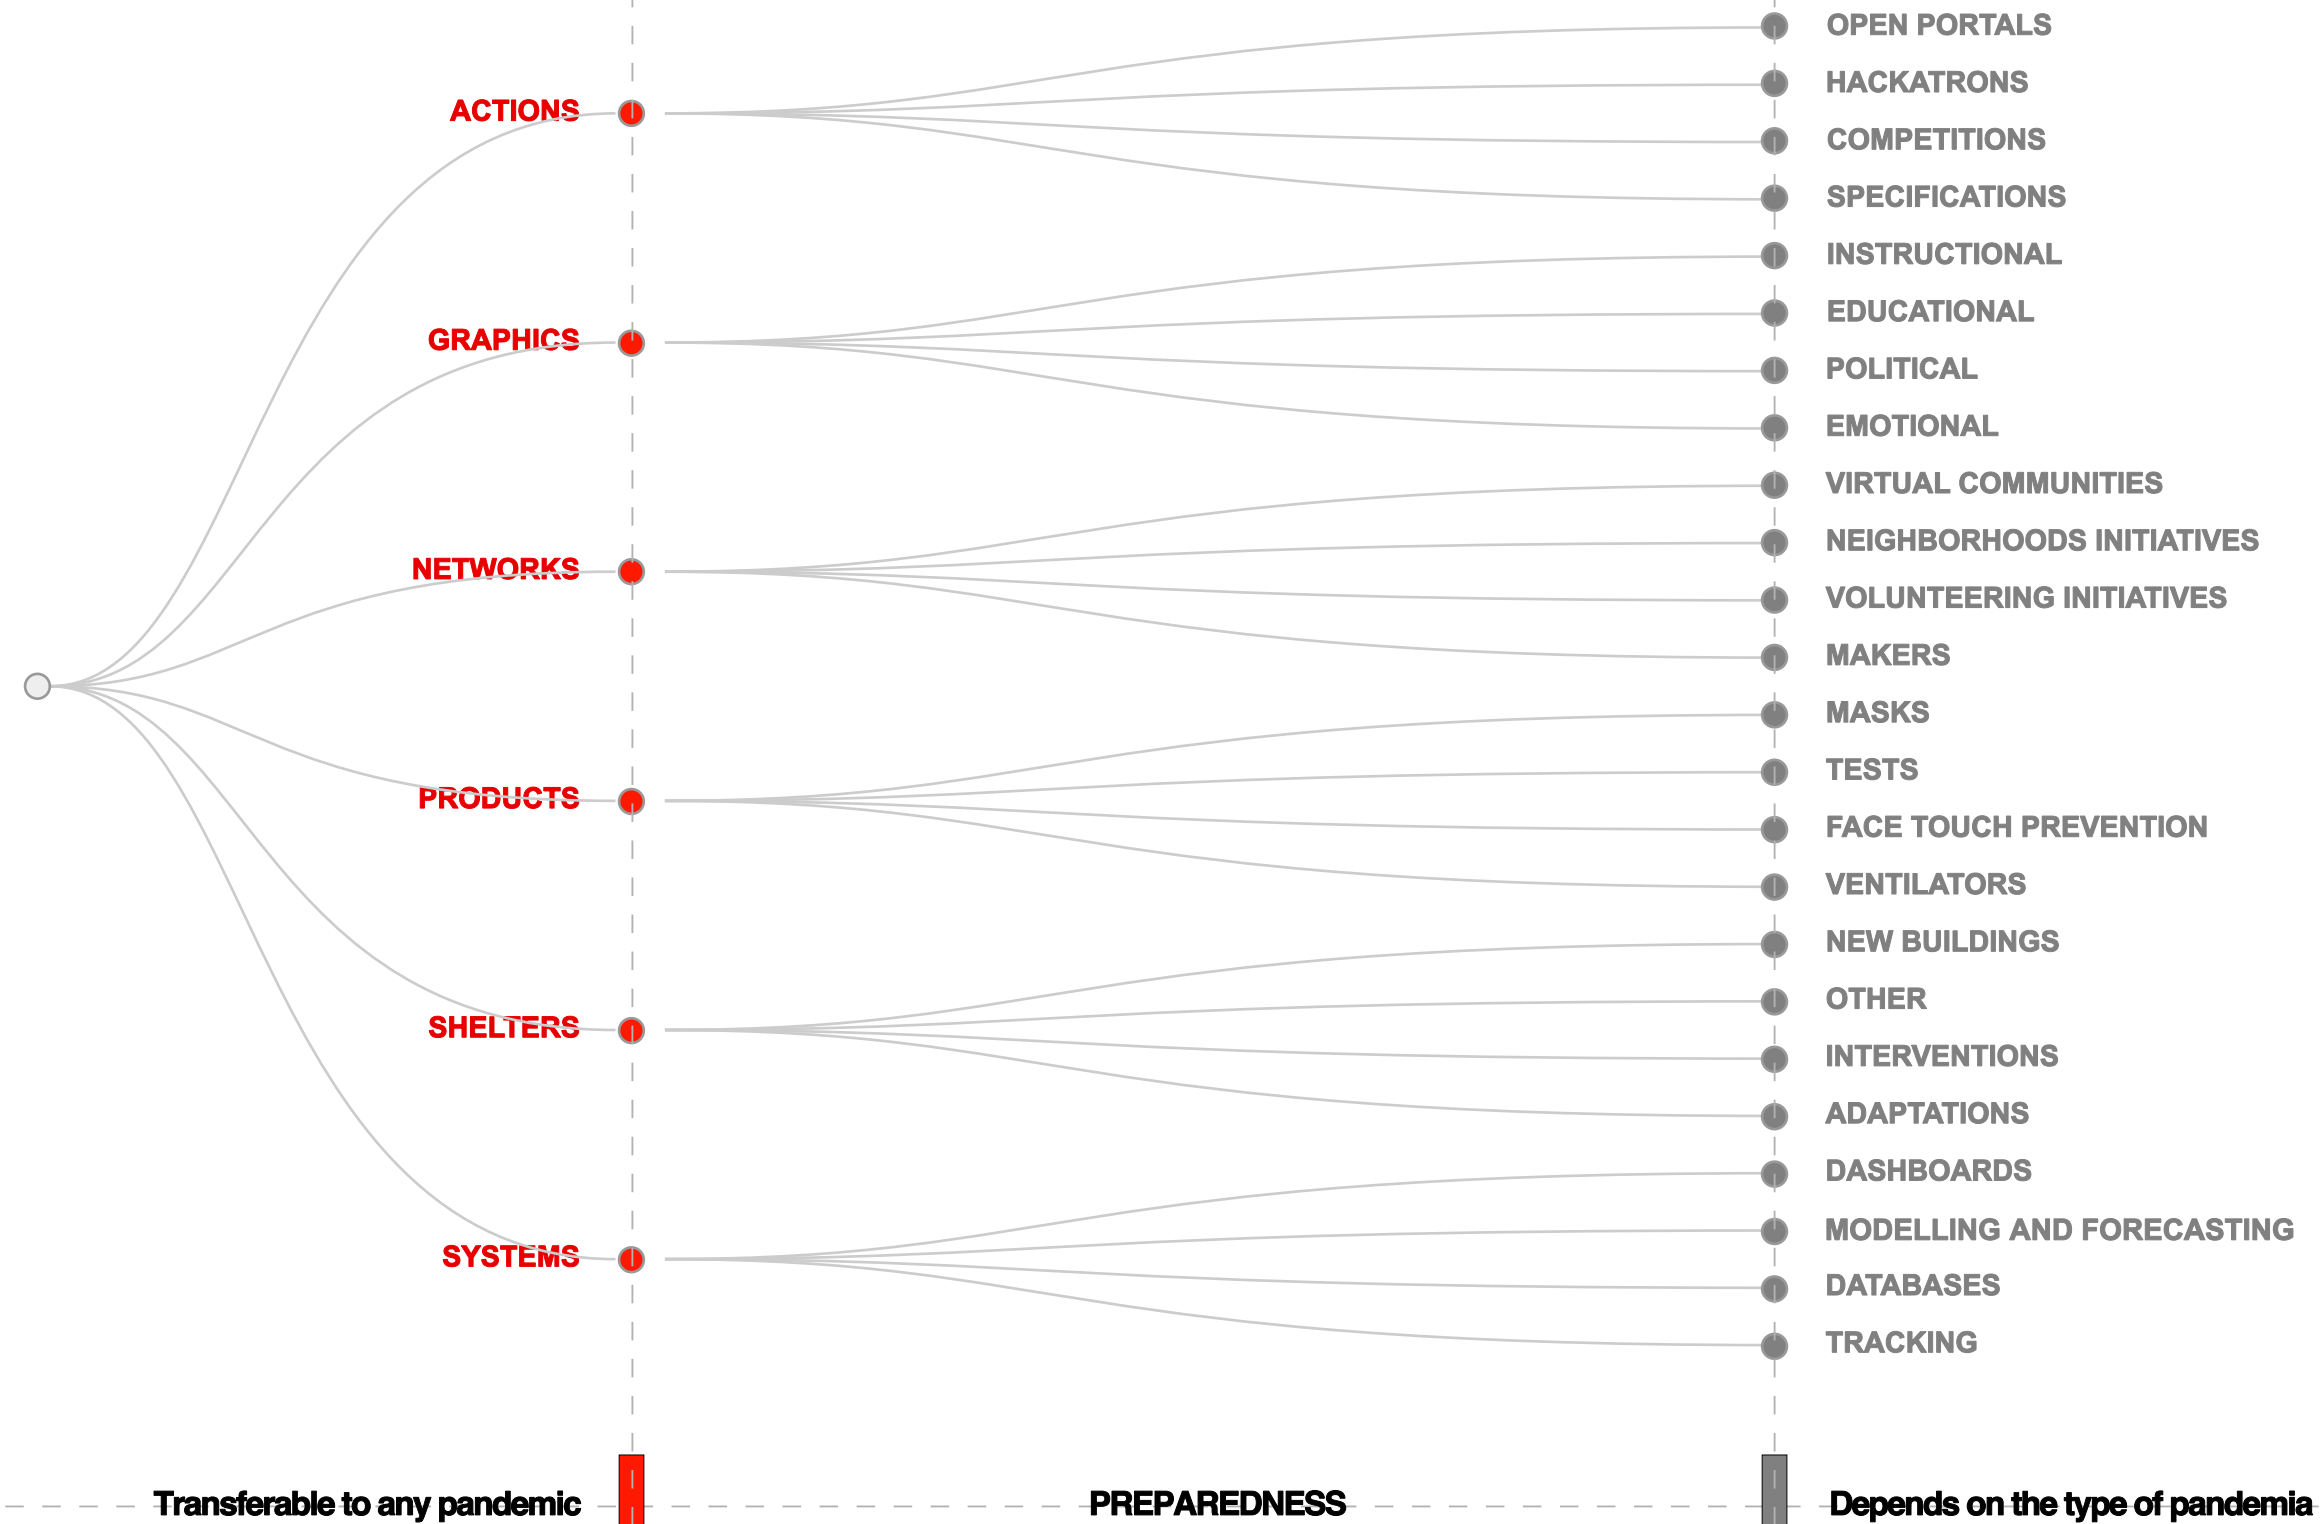

As this book makes very clear, designing with care turns out to be extremely useful, which could lead us to think the more care we use the better things will get. But care has become an element for both profit and pleasure and how we care for the world is constantly being conditioned in the same way marketing has conditioned consumers to consume. Clearly, designing with care will call for vigilance.

Not only will designing with care call for vigilance, it will also have to take good care of itself. Despite all the energy and effort thrown at sustaining life on the one planet we share, now all we can do is constantly recalibrate downward earth's carrying capacity. Care needs to be taken with the calibrations and the calibrations tell us how much more care we need to take.

Even with the massive and compelling design response to the Covid-19 crisis caring for design is not very visible. By caring for design is the responsible job of stewardship and only with care is the design for the future possible...after which, we will have to steward design to take care of it.

Designing with care has pitfalls. We are inevitably careless and we need to be careful about our carelessness. No matter how careful we might be, all design thought and action has consequences which raises a number of dilemmas and paradoxes that underpin the positionality of what-might-not-become.

Paul A. Rodgers, Craig Bremner, and Fernando Galdon
